

## **Problem Solution Fit**

|                      |                                                |
|----------------------|------------------------------------------------|
| <b>Date</b>          | 28-09-2026 to 30-09-2026                       |
| <b>Team ID</b>       | SWTID-2026-9565                                |
| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> |                                                |

### **Problem-to-Solution Mapping**

| Problem                          | Project Solution                                           | Expected Effect                              |
|----------------------------------|------------------------------------------------------------|----------------------------------------------|
| Incomplete Incident records      | UI Policy makes Assignment Group mandatory for High Impact | Required assignment information is enforced. |
| Manual Urgency entry             | onChange Client Script sets Urgency to High                | Reduces manual entry and incorrect values.   |
| Users changing controlled fields | UI Policy Action makes Urgency read-only                   | Field behaviour is controlled.               |
| Missing Assigned To at save      | onSubmit checks Assigned To before save                    | Invalid High Impact submission is blocked.   |
| Unauthorized State list edits    | onCellEdit blocks direct State changes                     | List-based State changes are prevented.      |
| Need for valid form updates      | Form-based State update remains allowed                    | Normal form workflow is preserved.           |

### **Solution Fit**

The solution directly addresses the defined Incident data-entry problems by placing the required rules at the user-interface level. UI Policies handle conditional field behaviour, while Client Scripts handle automatic updates, save-time validation and list-edit control.
