

Performance Testing

Date	28-09-2026 to 30-09-2026
Team ID	SWTID-2026-9565
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	

Testing Approach

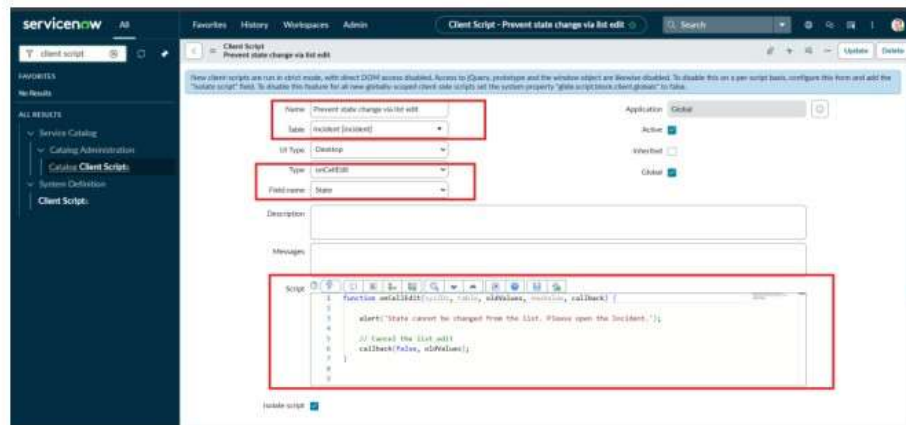

Testing focuses on functional response and client-side behaviour under the defined Incident conditions. The project documentation specifies five test scenarios.

ID	Test Case	Input / Action	Expected Result	Result
TC-01	Mandatory Enforcement	Impact = High; Assigned To empty; Submit	Save blocked; error shown; required controls active	Pass
TC-02	Successful Save	Impact = High; Assigned To filled; Submit	Incident saves successfully; configured behaviours continue	Pass
TC-03	Reverse Condition	Change Impact High → Medium	Assignment Group no longer mandatory; Urgency editable	Pass
TC-04	List Edit Blocking	Incident list → double-click State	Alert appears; State remains unchanged	Pass
TC-05	Form-based State Update	Incident form → change State → Update	State change saves successfully	Pass

Performance / Behaviour Observations

- Client-side rules are lightweight and focused on required Incident fields.
- Validation occurs at the user interface before submission.
- Automatic Urgency update occurs when Impact changes to High.
- List-edit State changes are blocked without affecting normal form updates.
- Reverse condition restores field behaviour when Impact is changed away from High.

Test Evidence

Task 6: Testing the Configuration

Activity 1: Test Mandatory Enforcement

- 1. Navigate to Incident:**
Go to Incident → Create New to open a new Incident form.
- 2. Set the Impact Field:**
Select **High** for the **Impact** field. This will trigger the UI Policy and Client Script behaviors you configured earlier.
- 3. Leave Assigned To Empty:**
Do not fill in the **Assigned To** field. This will test the onSubmit Client Script that prevents saving if Assigned To is missing.
- 4. Click Submit:**
Attempt to save the Incident record.
- 5. Verify the Result:**
