Team ID	SWTID-2026-9565
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	

User Journey: Service Desk / Incident User

The journey describes how a user creates or updates an Incident and how the configured client-side controls respond at each stage.

Stage	User Action	User Need / Expectation	System Behaviour	Pain Point / Improvement
1. Open Incident	Open Incident → Create New	Clear form and fields	Incident form loads	Uncertainty about required fields → form guidance
2. Enter Impact	Select Impact = High	Know what changes	UI Policy condition becomes true	Need immediate field feedback
3. Complete Assignment	Select Assignment Group / Assigned To	Know mandatory information	Assignment Group becomes mandatory; Assigned To checked on submit	Missing information is detected
4. Update Urgency	Impact changes to High	Avoid manual mistakes	onChange sets Urgency = High; UI Policy controls editability	Reduces manual entry
5. Submit	Click Submit	Record should save only when valid	onSubmit validates Assigned To	Invalid submission is blocked
6. Edit State	Try direct list edit	Prevent unauthorized list change	onCellEdit blocks State change	State remains unchanged
7. Form Update	Change State on Incident form	Valid form update should work	Form-based State update is allowed	Controlled update is supported
